Codetantra practical 3

3.1.1 problem statement

Write a Python program to create a NumPy array based on user input and display the following:

- The created NumPy array.
- The number of dimensions of the array using `ndim`
- The shape of the array using `shape`
- The total number of elements in the array using `size`

Assume all input elements are valid integers.

Input Format:

- The first line contains two space-separated integers, `rows` and `columns`, representing the number of rows and the number of columns.

- The next lines contain space-separated integers representing the elements of the array, entered row by row.

Output Format:

- The created NumPy array (printed as a 2D array).
- An integer representing the number of dimensions of the array.
- A tuple representing the shape of the array.
- An integer representing the total number of elements in the array.

Note: Use `reshape()` function to reshape the input array with the specified number of rows and columns.

Code:

```
import numpy as np
r,c = map(int, input().split())
elements = []
for _ in range(r):
```

```
elements.extend(map(int, input().split()))  
array = np.array(elements).reshape(r,c)
```

```
print(array)
```

```
print(array.ndim)
```

```
print(array.shape)
```

```
print(array.size)
```

Output:

Practical Lab Assignment

3.2.1 problem statement

The given code takes two 3×3 matrices, `matrix_a`, and `matrix_b`, as input from the user and converts them into NumPy arrays.

Task:

You are required to compute and display the results of the following matrix operations:

1. Addition ($\text{matrix_a} + \text{matrix_b}$)
2. Subtraction ($\text{matrix_a} - \text{matrix_b}$)
3. Element-wise Multiplication ($\text{matrix_a} * \text{matrix_b}$)
4. Matrix Multiplication ($\text{matrix_a} . \text{matrix_b}$)
5. Transpose of Matrix A

Input Format:

- The user will input 3 rows for , each containing 3 integers separated by spaces.
- Similarly, the user will input 3 rows for , each containing 3 integers separated by spaces.

Output Format:

The program should display the results of the operations in the following order:

1. The result of Addition.
2. The result of Subtraction.
3. The result of Element-wise Multiplication.
4. The result of Matrix Multiplication.
5. The Transpose of Matrix A.

Code:

```
import numpy as np
```

Input matrices

print("Enter Matrix A:")

matrix_a = np.array([list(map(int, input().split()))
for i in range(3)])

print("Enter Matrix B:")

matrix_b = np.array([list(map(int, input().split()))
for i in range(3)])

Addition

addition_result = matrix_a + matrix_b

print("Addition (A + B):")

print(addition_result)

Subtraction

subtraction_result = matrix_a - matrix_b

print("Subtraction (A - B):")

print(subtraction_result)

Multiplication (element-wise)

elementwise_multiplication_result = matrix_a *

```
matrix_b
print("Element-wise Multiplication (A * B):")
print(elementwise_multiplication_result)
# Matrix multiplication (dot product)
matrix_multiplication_result = np.dot(matrix_a,
matrix_b)
print("A dot B:")
print(matrix_multiplication_result)
# Transpose
transpose_a = matrix_a.T
print("Transpose of A:")
print(transpose_a)
```

Enter Matrix A:	Enter Matrix A:

3.2.2 problem statement

You are given two arrays arr1 and arr2. You need to perform horizontal and vertical stacking operations on them using NumPy.

- Horizontal Stacking: Stack the two matrices horizontally (side by side).
- Vertical Stacking: Stack the two matrices vertically (one below the other).

Input Format:

- The program should first prompt the user to

input two 3x3 arrays.

- Each array consists of 3 rows, and each row contains 3 space-separated integers.
- The user will input the two arrays row by row.

Output Format:

- The program should display the result of the Horizontal Stack (side-by-side stacking) of the two arrays.
- The program should then display the result of the Vertical Stack (one below the other) of the two arrays.

Code:

```
import numpy as np
```

```
# Input matrices
```

```
print("Enter Array1:")
```

```
arr1 = np.array([list(map(int, input().split())) for i  
in range(3)])
```

```
print("Enter Array2:")
```

```
arr2 = np.array([list(map(int, input().split())) for i
```

```
in range(3)])  
# Perform horizontal stacking (hstack)  
a=np.hstack((arr1,arr2))  
print("Horizontal Stack:")  
print(a)  
  
# Perform vertical stacking (vstack)  
b=np.vstack((arr1,arr2))  
print("Vertical Stack:")  
print(b)
```

Output:

Enter Array1:

1 2 3

3.2.3 problem statement

Write a Python program that takes the following inputs from the user:

- Startvalue: The starting point of the sequence.
- Stopvalue: These sequences should end before

this value.

- Step value: The increment between each number in the sequence.

The program should then generate a sequence using numpy based on these inputs and print the generated sequence.

Input Format:

- The user will input three integer values: start, stop, and step, each on a new line.

Output Format:

- The program should print the generated sequence based on the input values.

Code:

```
import numpy as np
```

```
# Take user input for the start, stop, and step of the sequence
```

```
start = int(input())
```

```
stop = int(input())
```

```
step = int(input())
```

```
# Generate the sequence using np.arange()
```

```
a=np.arange(start,stop,step)
```

```
print(a)
```

```
# Print the generated sequence
```

3.2.4 problem statement

You are given two arrays A and B. Your task is to complete the function `array_operations`, which will convert these lists into NumPy arrays and perform the following operations:

1. Arithmetic Operations:

- Compute the element-wise sum, difference, and product of the two arrays.

2. Statistical Operations:

- Calculate the mean, median, and standard deviation of array A.

3. Bitwise Operations:

- Perform bitwise AND, bitwise OR, and bitwise XOR on the arrays (ex: $A_i \text{ OR } B_i$).

Input Format:

- The first line contains space-separated integers representing the elements of array A.
- The second line contains space-separated integers representing the elements of array B.

Output Format:

- For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as shown in sample test cases.

Code:

```
import numpy as np

def array_operations(A, B):

    # Convert A and B to NumPy arrays
    A = np.array(A)
    B = np.array(B)

    # Arithmetic Operations
    sum_result = A + B
    diff_result = A - B
```

```
prod_result = A * B
```

```
# Statistical Operations
```

```
mean_A = np.mean(A)
```

```
median_A = np.median(A)
```

```
std_dev_A = np.std(A)
```

```
# Bitwise Operations
```

```
and_result = A & B
```

```
or_result = A | B
```

```
xor_result = A ^ B
```

```
# Output results with one space between each  
element
```

```
print("Element-wise Sum:", ' '.join(map(str,  
sum_result)))
```

```
print("Element-wise Difference:", ' '.join(map(str,  
diff_result)))
```

```
print("Element-wise Product:", ' '.join(map(str,  
prod_result)))
```

```
print(f"Mean of A: {mean_A}")
```

```
print(f"Median of A: {median_A}")
```

```
print(f"Standard Deviation of A: {std_dev_A}")
    print("Bitwise AND:", ' '.join(map(str,
and_result)))
    print("Bitwise OR:", ' '.join(map(str, or_result)))
    print("Bitwise XOR:", ' '.join(map(str, xor_result)))
```

```
A = list(map(int, input().split())) # Elements of array
A
B = list(map(int, input().split())) # Elements of array
B
array_operations(A, B)
```

Output:

1 2 3 4	1 2 3 4
5 6 7 8	5 6 7 8
Element-wise Sum: 6 8 10 12	Element-wise Sum: 6 8 10 12

3.2.5 problem statement

The given code takes a list of integers as input and converts it into a NumPy array. Your task is to complete the code by:

- Creating a view of the original_array and assigning it to view_array.
- Creating a copy of the original_array and assigning it to copy_array.

After completing these steps, observe how modifying the view affects the original_array, while modifying the copy does not.

Input Format:

- A single line of space-separated integers.

Output Format:

- After modifying the view:

Original array after modifying view: <original_array>

View array: <view_array>

- After modifying the copy:

Original array after modifying copy: <original_array>

Copy array: <copy_array>

Code:

```
import numpy as np
```

```
inputlist = list(map(int,input().split(" ")))
```

```
# Original array
```

```
original_array = np.array(inputlist)
```

```
# Create a view
```

```
view_array = original_array.view()
```

```
# Create a copy
```

```
copy_array = original_array.copy()
```

```
# Modify the view
```

```

3.2.6 problem statement

The given code in the editor takes a single array, array1, as space-separated integers as input from the user.

Additionally, it takes the following inputs:

- search_value: The value to search for in the array.
- count_value: The value to count its occurrences in the array.
- broadcast_value: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

1. Searching: Find the indices where `search_value` appears in `array1` and print these indices.
2. Counting: Count how many times `count_value` appears in `array1` and print the count.
3. Broadcasting: Add `broadcast_value` to each element of `array1` using broadcasting, and print the resulting array.
4. Sorting: Sort `array1` in ascending order and print the sorted array.

Input Format:

1. A single line containing space-separated integers representing `array1`.
2. An integer `search_value` represents the value to search for in the array.
3. An integer `count_value` represents the value to count in the array.
4. An integer `broadcast_value` represents the value to add to each element of the array.

Output Format:

1. The indices where `search_value` occurs

in array1.

2. The count of occurrences of count_value in array1.
3. The array after adding the broadcast_value to each element.
4. The sorted array.

Code:

```
import numpy as np
```

```
# Input array from the user
```

```
array1 = np.array(list(map(int, input().split())))
```

```
# Searching
```

```
search_value = int(input("Value to search:
```

```
")) count_value = int(input("Value to count:
```

```
")) broadcast_value = int(input("Value to
```

```
add: ")) # Find indices where value matches
```

```
in array1
```

```
a=np.where(array1==search_value)[0]
```

```
print(a)
```

```
# Count occurrences in array1
```

```
b=np.count_nonzero(array1==count_value)  
) print(b)
```

```
# Broadcasting addition
```

```
c=array1 + broadcast_value
```

```
print(c)
```

```
# Sort the first array
```

```
d=np.sort(array1)
```

```
print(d)
```

3.2.7 problem statement

Write a Python program that takes the file name of a CSV file containing student details, including roll numbers and their marks in three subjects as input, reads the data, and performs the following operations:

- Print all student details: Display the complete

details of all students, including roll numbers and marks for all subjects.

- Find total students: Determine the total number of students in the dataset.
- Print all student roll numbers: Extract and print the roll numbers of all students.
- Print Subject 1 marks: Extract and print the marks of all students in Subject 1.
- Find minimum marks in Subject 2: Identify the lowest marks in Subject 2.
- Find maximum marks in Subject 3: Identify the highest marks in Subject 3.
- Print all subject marks: Display the marks of all students for each subject.

Find total marks of students: Compute the total marks for each student across all subjects.

- Find the average marks of each student: Compute the average marks for each student.
- Find average marks of each subject: Compute the average marks for all students in each subject.
- Find average marks of Subject 1 and Subject 2: Compute the average marks for Subject 1 and Subject 2.

- Find average marks of Subject 1 and Subject 3: Compute the average marks for Subject 1 and Subject 3.
- Find the roll number of students who scored 24 marks in Subject 2: Identify students who obtained exactly 24 marks in Subject 2 and print their roll numbers.
- Find the count of students who got less than 40 marks in Subject 1: Count the number of students who scored less than 40 marks in Subject 1.
- Find the count of students who got more than 90 marks in Subject 2: Count the number of students who scored more than 90 marks in Subject 2.
- Find the count of students who scored ≥ 90 in each subject: Count the number of students who scored 90 or more marks in each subject.
- Find the count of subjects in which each student scored ≥ 90 : Determine how many subjects each student scored 90 or more marks in.
- Print Subject 1 marks in ascending order: Sort and print the marks of students in Subject 1 in ascending order.

- Print students who scored between 50 and 90 in Subject 1: Display students who scored marks between 50 and 90 in Subject 1.
- Find index positions of students who scored 79 in subject 1: Identify the index positions of students who scored exactly 79 marks in subject 1.

Code:

```
import numpy as np
```

```
